**By taking care of soil and plant health, we preserve the one of ourselves**

Dear Sirs, we invite you to cooperation!

Flora-L Ltd. is a manufacturer of premium class organic fertilizers. Our products are safe for people and animals and improve environmental conditions. We use only natural technologies.

Original 3.5 kg plastic package

For small-scale and large scale wholesale buyers we can pack our products into respectively a 50 kg polypropylene bag or 0.5-1.5 t big bag.

Our fertilizer under the trademark "**EBG**" (**EBG Super soil mix**) contains a balanced set of micro- and macroelements useful for soil fertility and plant growth.

We use a living biosystem of California Red Worm for composting cattle manure and manufacturing one of the best of existing natural organic fertilizers.

**EBG Soil Mix** contains great amount of humine acids, which bind heavy metals and radionuclides in soil, and affects macroelements, making them reachable for the plants.

**EBG Soil Mix** also contains nutrients, which interact with soil mineral substances and form complex compounds. As a result, they get protected from washing-out and rapid dissolution in water and provide long-term nourishment of plants.

**EBG Soil Mix** enriches soil with bacteria, enzymes, humic acids, vitamins and natural antibiotics

beneficent for soil and plant health.

**EBG Soil Mix** could be a base for formation of fertile soil layer on deserts and unproductive land.

**EBG Soil Mix** is a black granulated substance (fraction size 1-3 mm), outdoor-free, with up to 45% dampness.

### **EBG Soil Mix:**

- recovers soil fertility and form fertile soil layer;
- binds heavy metals and radionuclides contained in soil;
- maintains plant immunity;
- stimulates plant growth and blossoming, increases colour intensity of lawn grass, leaves and flowers;
- ensures high survival ability of replanted trees.

Our fertilizer is an organic product. We take cattle manure (livestock dropping) and compost it for nearly half a year for all microbiological processes of decomposition could successfully end. Then our workers put the compost in rows and place worms. Special conditions such as air humidity, temperature, aeration are controlled for all the producing cycle. After the fertilizer is ready, and the WHOLE mass of biohumus was passed through organism of Red Californian Worm, our workers manually sieve the fertilizer to remove the worms, accidental pieces or rocks and parts of uncomposted organics.

As a result our fertilizer contain unique complex of soil microorganisms, which not only feed the plants and increase the crop, but restore the soil and turn unproductive mud into fertile agricultural land and have a long-lasting effect.

In EBG Super soil mix we use a special combination of turf, chernozem soil and EBG Biohumus fertilizer.

**EBG Soil Mix** chemical composition\*:

Total nitrogen (N) content, (mass % on dry basis):	0.5
Available phosphate (P <sub>2</sub> O <sub>5</sub> ) content, (mass % on dry basis):	0.2
Potassium (K <sub>2</sub> O) content, (mass % on dry basis):	0.3
Water content, (mass % on dry basis):	30 – 45
Organic matter content, (mass % on dry basis):	>30
pH of salt solution, pH:	6,0-8,5

\* pH and NPK values may be adjusted to a certain extent.
